

New Valve Function IMT-P-EV6/EV8 Pro

- 1) Fully automatic regeneration: Regeneration is controlled by both flow and time.
- 2) Leakage prevention monitoring: Triple monitoring and safety guarantee including leak detection sensor, water consumption, and water usage time.
- 3) Intelligent control system: WiFi-enabled smart IoT, allowing remote control via mobile APP without the need for on-site operation.
- 4) Simultaneous use of raw water during regeneration (i.e., 24-hour water supply).

- 5) Soft water regeneration (i.e., replenishing soft water to dissolve salt during regeneration).
- 6) 24-hour soft water supply with multiple units connected in series: Simply staggering the "regeneration initiation time" of at least one valve from the others can achieve 24-hour soft water supply.

- 7) Optional dry salt and wet salt regeneration modes.

- 8) Remote wireless control: Enables remote control of valve opening and closing within a range of 10-30 meters. The main unit can simultaneously pair with 1 remote control and 8 detection points, enabling quick and precise detection of leakage points and valve closure.

- 9) Dual power automatic switching protection: Equipped with a built-in lithium battery and automatic dual power switching, with automatic charging and discharging protection functions, ensuring leak prevention during power outages.

- 10) Salt shortage alarm reminder: When the salt level is insufficient and affects the resin regeneration effect, the system will alarm and remind the user to add salt.
